# REPAIRABILITY SCORE:

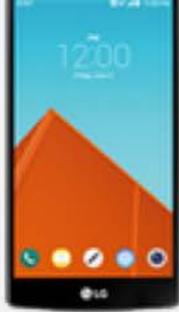

# Smartphone Repairability

Our engineers disassembled and analyzed each smartphone, awarding a repairability score between zero and ten. Ten is the easiest to repair.

## How we rate devices:

A device with a perfect score will be relatively inexpensive to repair because it is easy to disassemble and has a service manual available. Points are docked based on the difficulty of opening the device, the types of fasteners found inside, and the complexity involved in replacing major components. Points are awarded for upgradability, use of non-proprietary tools for servicing, and component modularity.

LG  
**G4**  
2015

- Rear panel and battery can be removed with no tools.
- Many components are modular and can be replaced independently.
- LCD is fused to the glass.

8

Google  
**Nexus 5**  
2013

- Modular design allows replacement of individual components.
- Standard Phillips screws used throughout.
- LCD is fused to the glass.

8

Samsung  
**Galaxy S4**  
2013

- Battery is easy to replace.
- Very easy to open for access to internal components.
- Components adhered to the back of a fused display assembly.

8

Blackberry  
**Z10**  
2013

- Battery is easy to replace.
- Standard screws make the device easy to open.
- Smaller components are strongly adhered in place.

8

Samsung  
**Galaxy Note II**  
2012

- Battery is easy to replace.
- Very easy to open for access to internal components.
- Components adhered to the back of a fused display assembly.

8

Amazon  
**Fire**  
2014

- External, non-proprietary screws make getting inside straightforward.
- The four Dynamic Perspective cameras are encased in glue.
- The phone is not modular, increasing the cost of replacement parts.

3

HTC  
**One M9**  
2015

- Standard Phillips screws make the rear case easier to open.
- The display assembly is the hardest component to replace.
- Battery is buried under motherboard and adhered to midframe.

2

HTC  
**One M8**  
2014

- Standard Phillips screws make the rear case easier to open.
- The display assembly is the hardest component to replace.
- Battery is buried under motherboard and adhered to midframe.

2

Apple  
**iPhone**  
2007

- Standard Phillips screws used throughout.
- Hidden clips make it nearly impossible to open rear case without damaging it.
- Soldered battery is very difficult to replace.

2

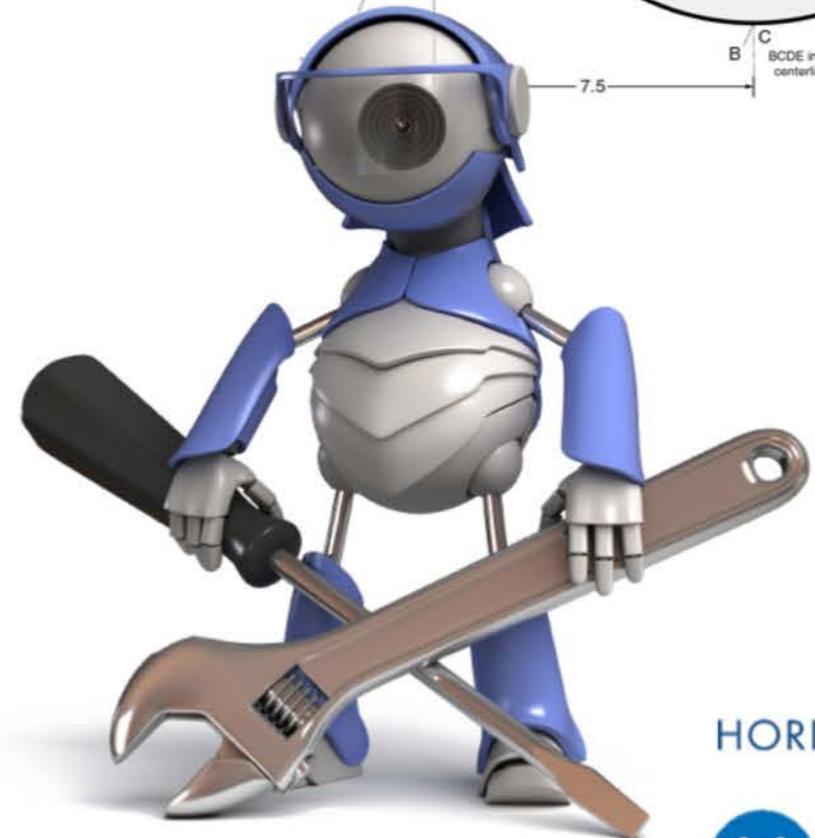

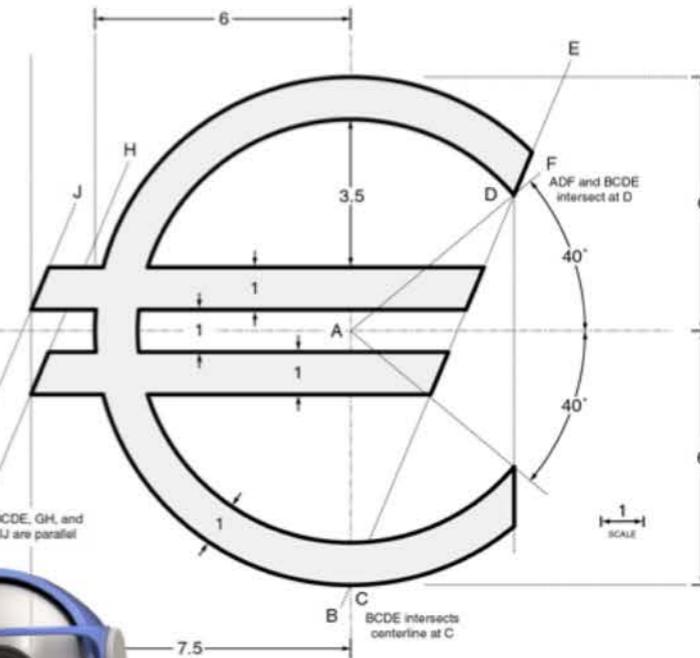

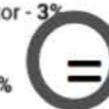

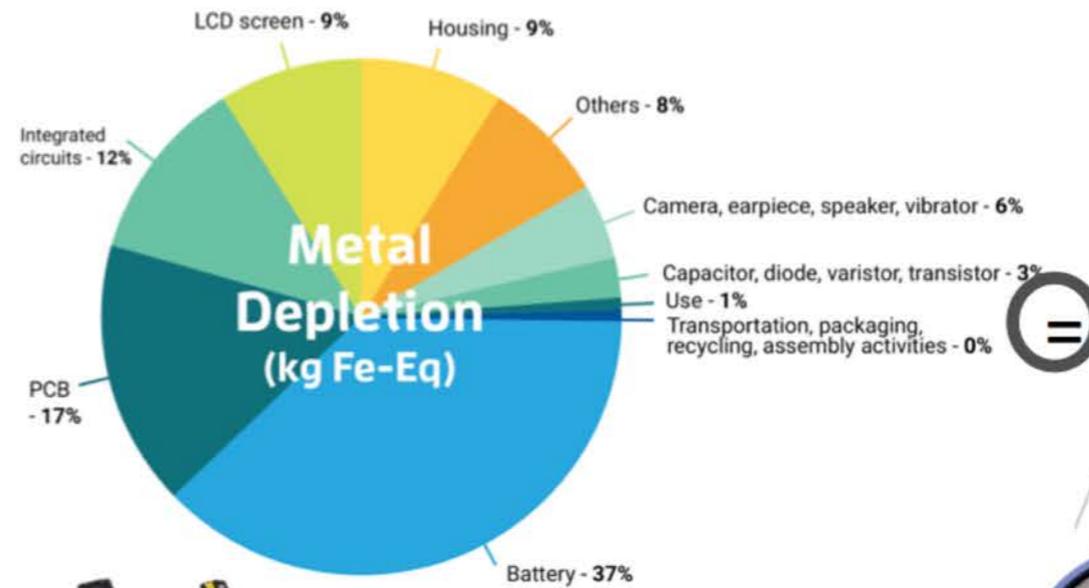

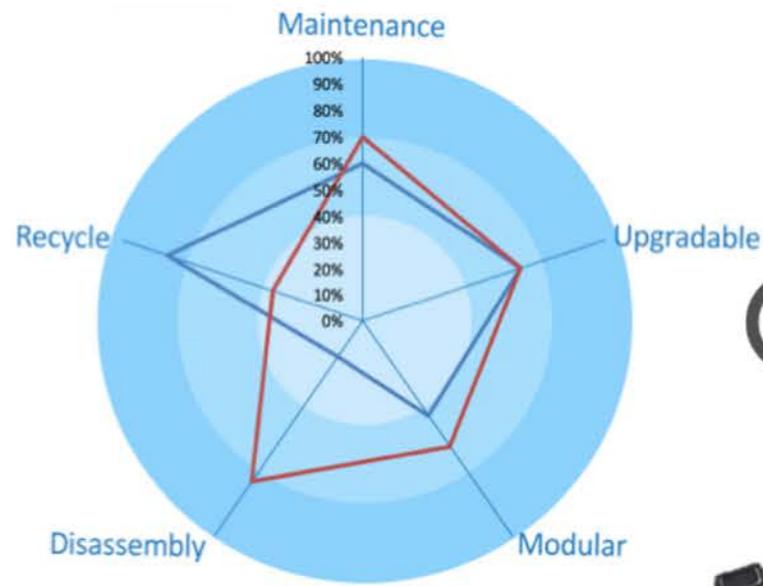

HTC  
**One**  
2013

- Solid external construction improves durability.
- Virtually impossible to open without extreme damage to rear case.
- Battery is buried under motherboard and adhered to midframe.

# EU Grant Project

# sustainablySMART

# Project Objectives

---

## Our task: To develop a validated reparability scoring system

- SustainablySMART will incentivize and advocate for design for repair / reuse / remanufacturing
- Repair, reuse and remanufacturing require basically the same design features
- We'll develop a system of algorithms to allow for a reproducible ranking of mobile devices in relation to these objectives
- The results will be communicated to policy makers and are intended to be reflected in eco-labelling

# Repair Scenario Considered

- Target audience: self-repair / laypeople
- Part replacement, not part repair
- Diagnosis is out of scope
- Critical components are accounted for
- Results must be stable over time

# Selection Principles for Criteria

**Relevance** (does the criterion address an essential aspect influencing the likelihood of repair in scenarios considered? Is the criterion the only/best one to address said aspect i.e. if we dropped this criterion, would we miss this essential aspect?)

**Feasibility / objectivity / repeatability** of verification (can we define the criterion in such a way that it can be assessed in a reliable and consistent way regardless of the person conducting the assessment?)

**Potential for differentiation between products** ('minimal pair': is there a series of relevant products i.e. smartphones or tablets currently on the market or expected to hit the market in max. 2 years, whose varying levels of reparability can (only) be distinguished by this criterion?)

# Selected Criteria / Rationale

## 1 — Availability of information (Q)

Repair guides or service manuals ensure reliable ways of repairing the product for all potential repair actors. Having access to repair information reduces the risk of repair failures and thereby also increases the likelihood of the repair being undertaken, since fear of breaking a product decreases when a manual is available.

## 2 — Deterrent Messaging (Q)

Voiding warranty or other issues that disincentivise opening up a product stand in the way of actually repairing and thus extending the product life.

## 3 — Path of Entry (EoD)

Before initializing a repair process, the repairer should be confident that it is possible to finish the repair successfully. Whether the product itself encourages or discourages the repairer to open the casing (how daunting is it to open up the product) is therefore a determining factor for the likelihood of repair. The assessment focuses on the ease of opening up the exterior (the amount of force) and the tools needed to do so (from fingers only to the use of uncommon tools).

## 4 — Visual Cues (Q)

Visual mapping and identification of the components (e.g. battery), its fasteners (e.g. screws) and cable connectors (e.g. ZIF) by means of codes, icons or colour could help the repairer to initiate and run through the process of disassembly with more confidence. It also reduces the chance of overlooking fasteners or connectors and therefore improves the chances of success.

## 5 — Spare part availability (Q)

Without critical spare parts, it is impossible to repair a product and bring it back to working functionality. Critical components can be made available to the general public for DIY repair, only to authorized repair workshops, or not be made available at all. Acquiring a critical spare part for a reasonable price, in an easy and quick way, contributes to a successful repair.

## 6 — Type of tools needed (EoD)

The number of tools needed to replace critical components, as well as their precise type and their availability, strongly influence the chance of initializing and successfully finishing the repair. We have divided the specific tools that can be needed for smartphone or tablet repair into classes corresponding to those defined in PrEN54445, from class A (Common Tools), class B (Product specific tools), class C (Commercially available tools) to class D (Proprietary tools).

## 7 — Accessibility for repair (EoD)

The accessibility of critical components, which fail most often, is a crucial factor for repair success. The accessibility of a component depends on the minimum number of steps to reach the component and the number of “difficult fasteners” needed to overcome to reach the component.

## 8 — Difficulty to repair (EoD)

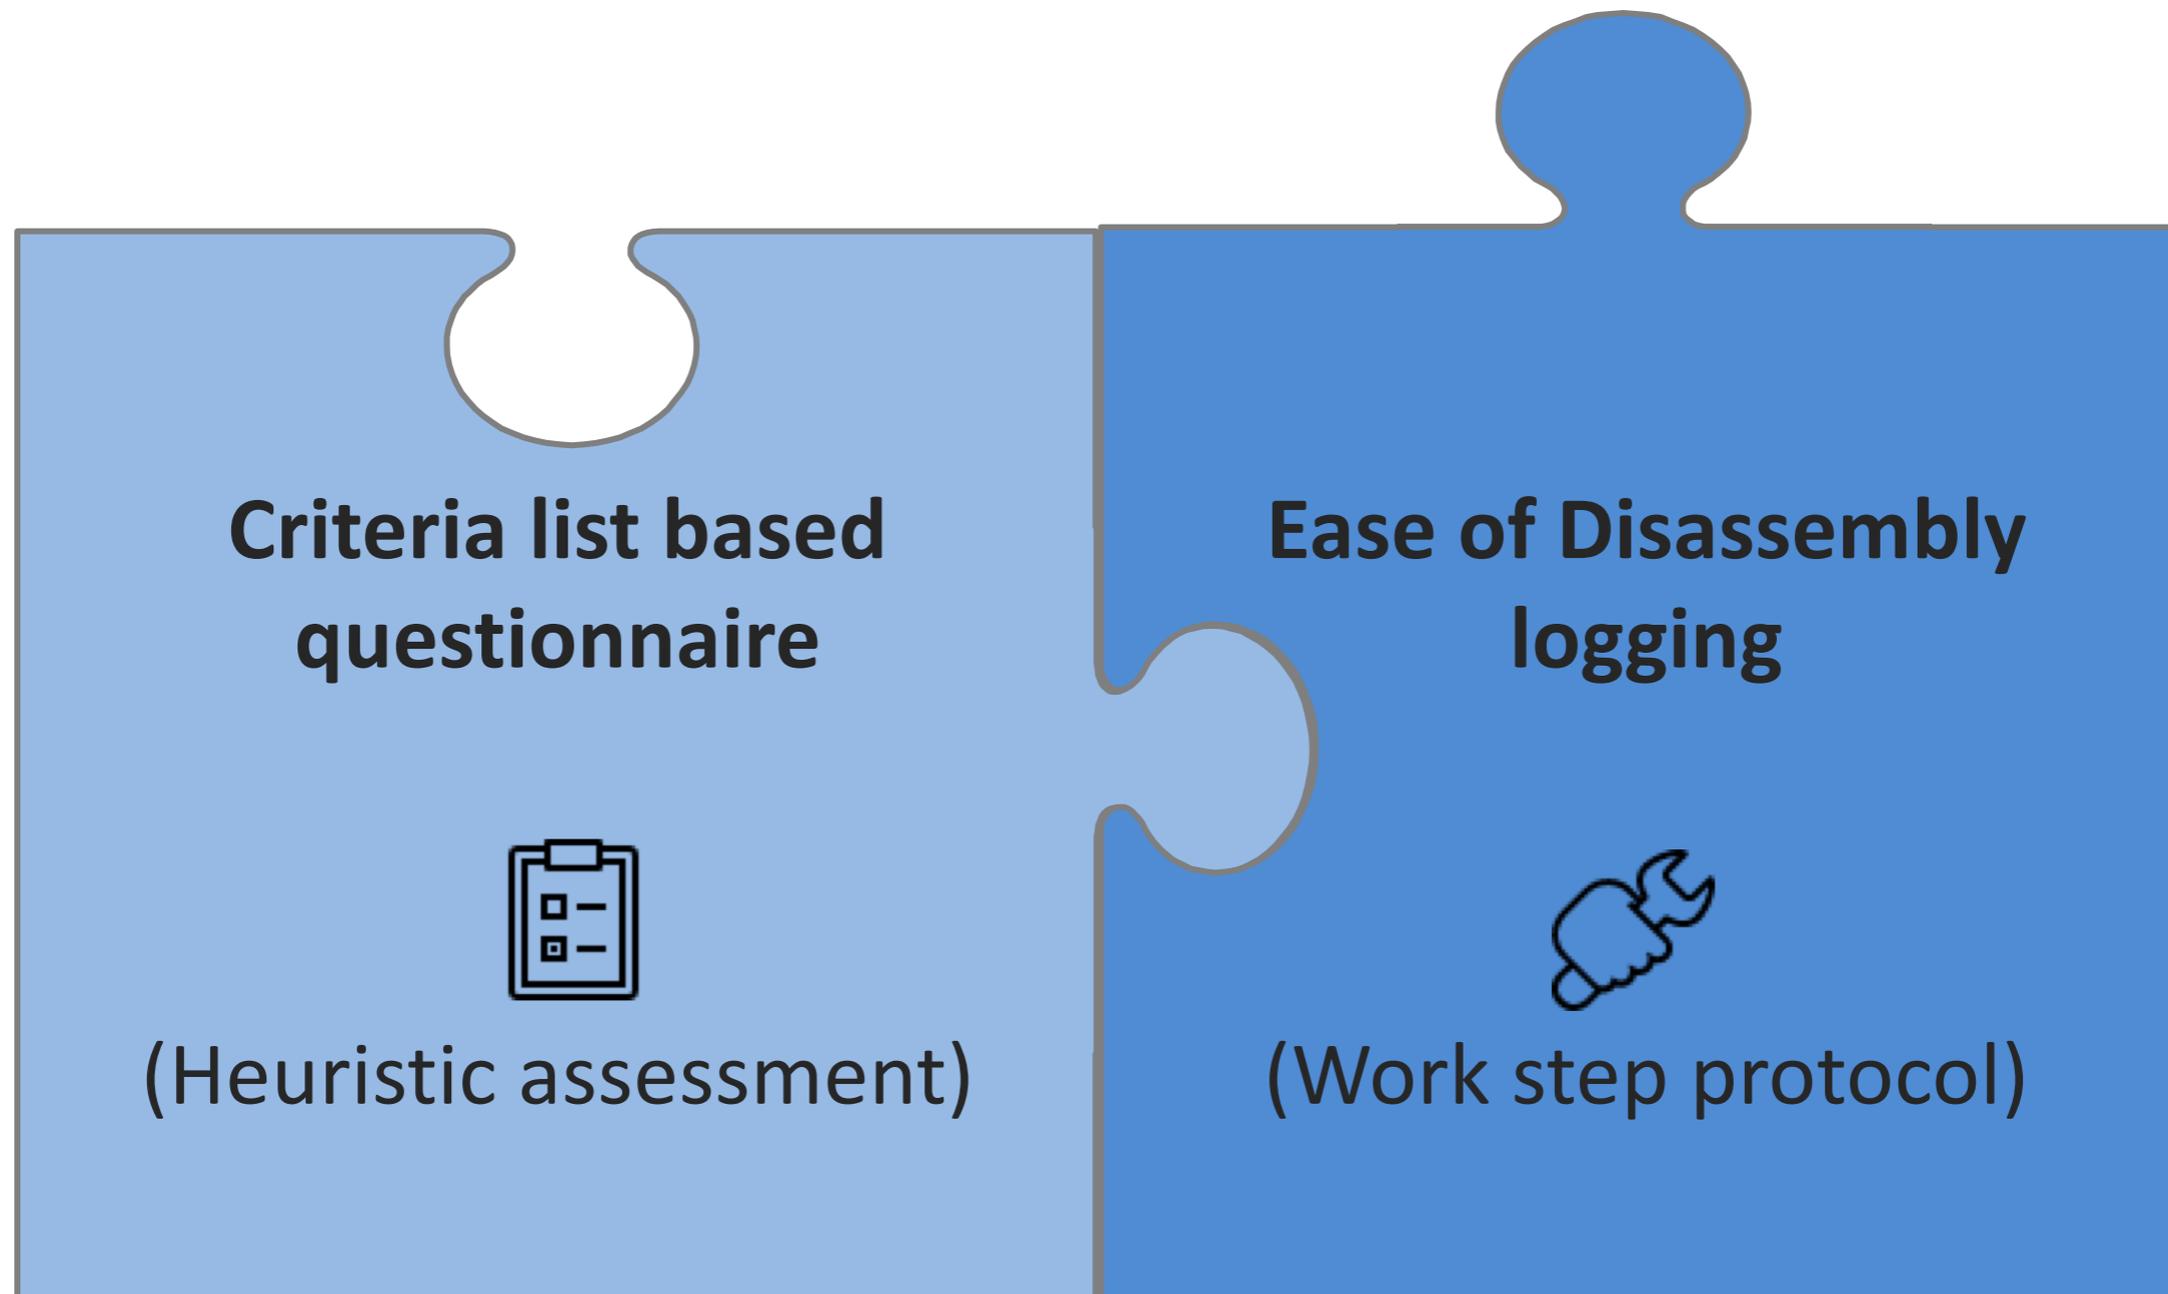

The need for high force, difficult positioning of tools or additional activities adversely affect the accessibility of critical components. “Difficult fasteners” are connecting technologies which negatively influence the time-to-access the component and the overall repair experience and can be defined when the connecting technology 1) requires the use of specialized tools like secured screwdrivers, 2) is difficult to separate like glue or one-way screws, or 3) is difficult to reach like recessed or hidden screws.

## 9 — Health and safety risk (Q + EoD)

Any risk of injury leads to a lower chance of actually initializing and successfully finishing the repair. We evaluate three aspects influencing safety: 1) type of battery (risk of puncture), 2) need for the use of heat during the process and 3) use of high force for prying (increased risk of injuring the repairer).

# Basic Scoring Modules

# 1. Availability of Information

Repair guides or service manuals ensure reliable ways of repairing the product for all potential repair actors. Having access to repair information reduces the risk of repair failures and thereby also increases the likelihood of the repair being undertaken, since fear of breaking a product decreases when a manual is available.

Identify if the manufacturer makes the following information available with regard to screen and battery replacement.

1. When looking at the product itself or on the manufacturers website...

- Can you find a unique product identifier on the product itself? ⓘ
- Can you find an identification code on the battery component? ⓘ
- Can you find an identification code on the screen component? ⓘ
- Can you identify the correct replacement part for battery replacement by entering the product identification code online? ⓘ
- Can you identify the correct replacement part for screen replacement by entering the product identification code online? ⓘ
- Can you find a parts list for the product? ⓘ
- Can you find an exploded view visualization for the product? ⓘ
- Can you find a video for replacement of the battery? ⓘ
- Can you find a step-by-step repair guide for the replacement of the battery? ⓘ
- Can you find a video for replacement of the screen? ⓘ
- Can you find a step-by-step repair guide for the replacement of the screen? ⓘ

How do I assess this correctly?

# 6. Type of Tools Needed

The number of tools needed to replace critical components, as well as their precise type and their availability, strongly influence the chance of initializing and successfully finishing the repair. We have divided the specific tools that can be needed for smartphone or tablet repair into classes corresponding to those defined in PrEN45554, from class A (Common Tools), class B (Product specific tools), class C (Commercially available tools) to class D (Proprietary tools).

Repair, reuse or upgrade processes can be classified according to the tools necessary to carry out the repair. Table 4 gives an overview of process classification by necessary tools.

Processes corresponding to class A entail less constraints with regard to feasible repair processes corresponding to class B, etc.

Not all classes may apply to every type of product. When defining assessment procedures to determine the feasibility of a specific type of product to be repaired, reused or upgraded, the user of this standard should take into account the availability of a specific type of product to be repaired, reused or upgraded. This score should be combined with a weighting coefficient  $W_{\text{tool}, i}$  to form a factor that can be used in a comprehensive assessment of the ability of a product to be repaired, reused or upgraded (see section B.1.13.).

**Table 4 - Process classification by necessary tools**

Category Description	Class
Feasible with common tools	A
Feasible with product group specific tools	B
Feasible with other commercially available tools	C
Feasible with proprietary tools	D
Not feasible with any existing tool	E

The various classes of necessary tools are described below.

- **Common tools (class A):** A repair, reuse or upgrade process, which can be carried out: without the use of any tools, or using a tool or set of tools that is supplied with the product, or using only common general purpose tools as listed in Annex A of this standard.
- **Product group specific tools (class B):** A repair, reuse or upgrade process, which cannot be carried out with common tools as defined above (class A), but can be carried out with a tool or set of tools as

# Scoring Criteria: EoD Assessment

## Module 2: Ease of Disassembly Assessment

3. Path of entry
6. **Type of tools needed**
7. Accessibility for repair
8. Difficulty to repair
9. Health and safety risk

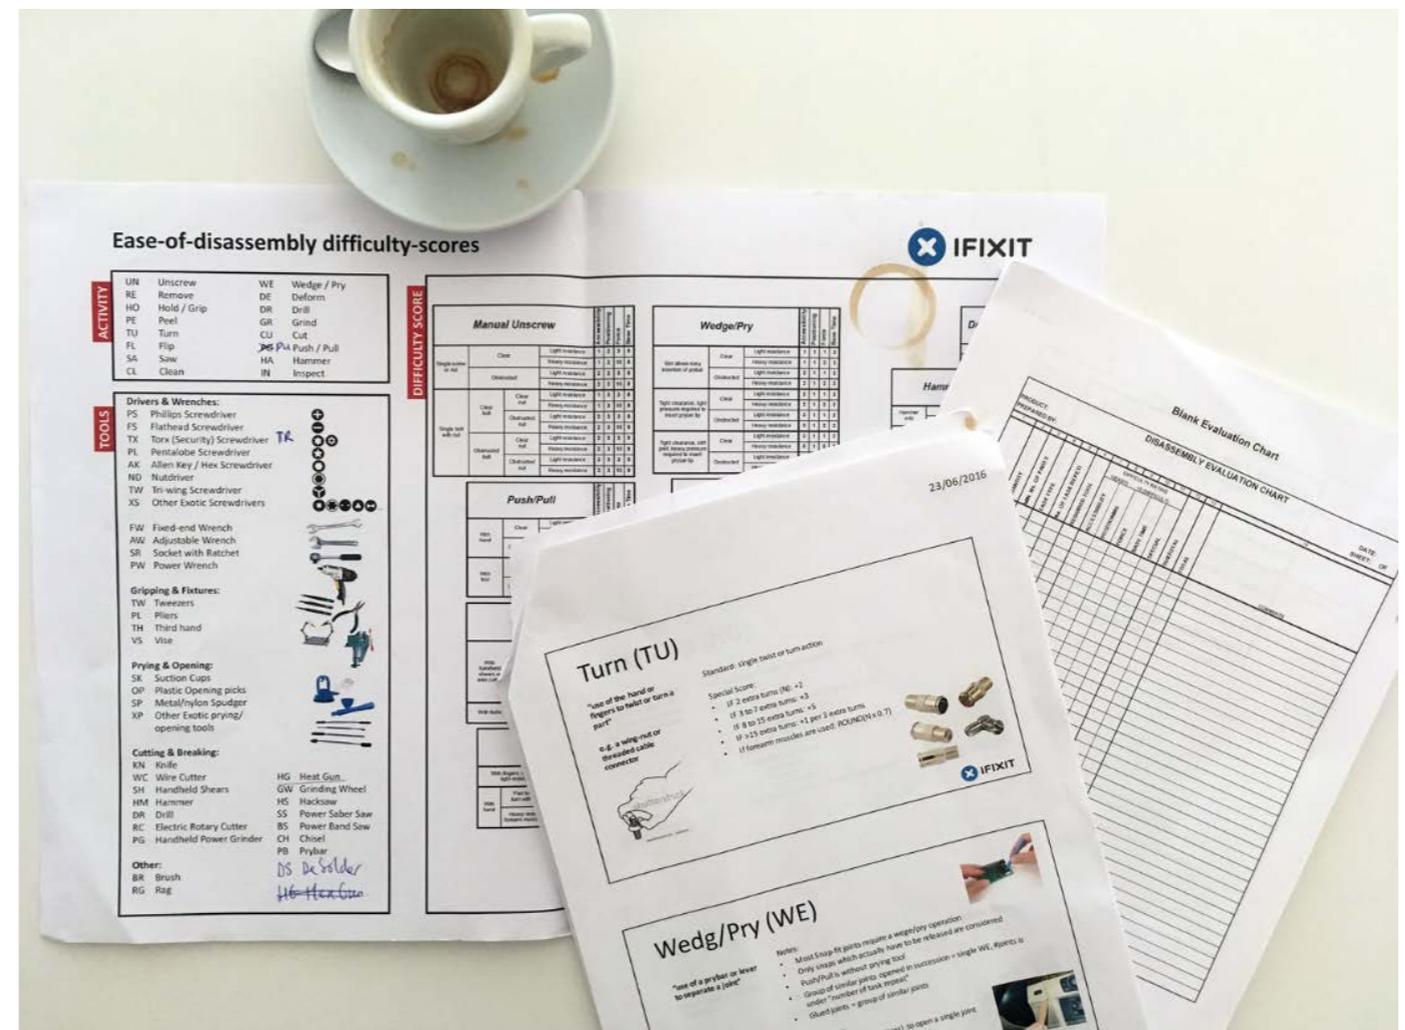

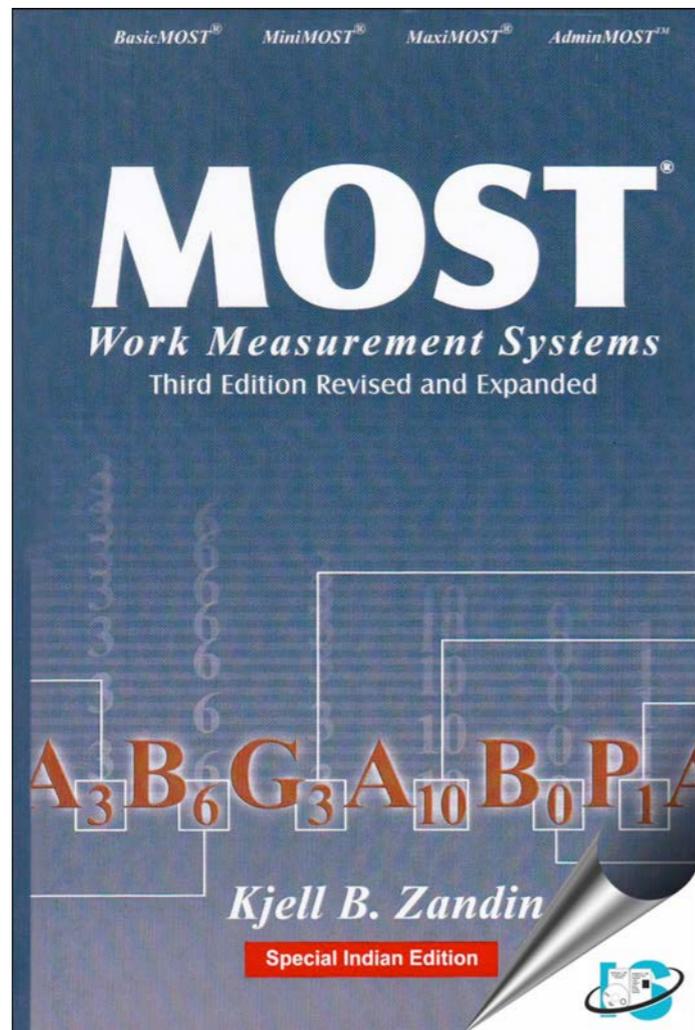

$$Cr_6 = 10$$

- $Count(Toolsize\{Underarm\})$
- $2 \cdot Count(Activity\{Deglue\})$
- $Count(Toolsize\{ClassD\})$

### Disassembly steps of Huawei Nexus 6P CC

Entry #	Component Name	Critical	Part of	Activity	#	Tool Used	Accessibility	Additional	
1	SIM card			Remove	1	Part	1;1;2;1

# EoD Software Tool (Offline)

The screenshot shows the 'Parts / Activites' dialog box in the EoD Software Tool. The dialog is overlaid on an Excel spreadsheet titled 'Balanced Score Card\_Repairability 0.17\_v24L - Excel'. The dialog is divided into two main sections: 'Sub-Assemblies / Parts' and 'Activity'.  
**Sub-Assemblies / Parts:** A table with columns for ID, Name, and Action. It contains two rows: '1.0 Base Detach' and '1.1 test Detach'.  
**Activity:** A form for defining an activity. Fields include:  
- Activity type: 'Detach' (dropdown)  
- Type of connection: 'Nut' (dropdown)  
- Description: 'removal of threaded nuts and bolts' (text box)  
- # of repetitions: '1' (text box)  
- Accessibility: 'Clear bolt & nut, heavy resistance' (dropdown)  
- Tool used: 'Alan\_socket' (dropdown)  
- Tool size: '3.5' (dropdown)  
- Comments: 'detach' (text box)  
- Special Codes: A list of checkboxes for various codes like '9 to 13 effective t', '14 to 19 effective', etc.  
Buttons at the bottom include 'Add new', 'Save', 'Reset/clear', and 'Close'.  
The background Excel spreadsheet has columns labeled 'Number' and 'Component'. The bottom status bar shows 'Average: 1 Count: 2 Sum: 2' and the system tray shows the time '4:21 PM 3/17/2017'.

This project has received funding from the European Union's Horizon 2020 research & innovation programme under grant agreement No 680640 and 730308
